Computer Architecture (2024-2025)

XueJin Cui (S5876095)

INSTRUCTIONS

1. Submission is only via Brightspace. Deadlines are strict.

2. The exercises in this assignment add up to 100 points. To calculate your grade simply divide the number of points by 10.

3. You must submit a pdf typeset in (La)TeX (no handwritten solutions) using **this** template.

4. Seeking solutions from the internet, from any external resource, or from any other person is prohibited.

5. Please note that the course lecturer reserves the right to ask the student submitting the assignment to explain the answers to any or all questions. If the student is unable to provide a satisfactory answer then that question may receive partial/no credit.

6. Of course, university policies on plagiarism always apply. In particular, any suspected plagiarism will be reported to the Board of Examiners.

:¿⁻

1. Convert the following decimal numbers to their 2's complement representations (use 8 bits for each number and truncate the fractional digits if necessary): **(10 points)**

   a) 42.3

   b) 6.3

   c) -13

   d) 0.04

Solution:
a) 0010101.0
b) 0110.0100
c) 11110011
d) 0.0000101

2. Perform the following operation in 2's complement. Indicate when an overflow happens. **(10 points)**

   a) 11001010 + 11101010

   b) 01011010 + 00110101

   c) 0011.1100 + 0100.0100

   d) 11010111 − 00001011

Solution:
a) 10110100
b) 10001111 overflow
c) 1000.0000 overflow
d) 11001100

3. Write IEEE floating point representation of the following decimal numbers.   **(10 points)**

   a) 19.45

   b) -0.028

> **Solution:**
>
> a) 01000001100110111001100110011010
>
> b) 10111100111001010110000001000010

4. The following numbers are in IEEE floating point representation. Write their decimal equivalents.
   (10 points)

   a) 10111100-11010101-00000000-00000000

   b) 00000000-00000100-00000000-00000000

> **Solution:**
>
> a) -0.0260009765625
>
> b) 3.67×10^{-40}

5. Design a circuit that outputs a 1 only if exactly two out of three inputs (A, B, C) are 1. (Use only NOT gates or logic gates with 2 inputs.)   **(15 points)**

> **Solution:**

6. Using a decoder and an encoder, design a circular incrementor circuit for 4-bit positive binary numbers. The input (a number between 0 and 7) will be incremented by one if it is less than 7. If the input is 7, the output should become zero.   **(15 points)**

> **Solution:**

7. Adding two numbers represented in scientific notation requires shifting floating points to make exponents equal before adding the fractions.   **(15 points)**
   Consider the following example:

   - Start with: $1.34 \cdot 10^3 + 2.1 \cdot 10^{-1}$
   - Then, shift the decimal point of the smaller number to equalize the exponents: $1.34 \cdot 10^3 + 0.00021 \cdot 10^3$
   - Then add the fractions, and normalize the result if necessary: $1.34021 \cdot 10^3$

   Assume we have two numbers $N = 14.25\ M = 0.5$

   a) Convert both numbers to IEEE floating point format.

   b) Add the numbers using the described procedure (include implicit 1).

   c) Normalize the result and convert it to IEEE format.

Solution:

8. Design a circuit using logic gates to compare two 2-bit positive numbers. The output should be: **(15 points)**

   - 10 if the first number is greater,
   - 01 if the second number is greater,
   - 00 if the two numbers are equal.

Solution:
